

# FINDING THE FIRST STEP:

CREATING A STILLBIRTH SCORECARD  
FOR THE UNITED STATES

**2021**

**STAR LEGACY**  
FOUNDATION

# FINDING THE FIRST STEP

Stillbirth in the United States is most commonly defined as a fetal death occurring at 20 weeks or more gestation. In 2021, 21,105 babies were stillborn across the US. This is greater than the total number of infant deaths from all causes. That number also represents roughly one-quarter of all stillbirths in high-income countries worldwide. Unfortunately, most of these families will never know what caused their baby's death.

The stillbirth rate in the United States has remained unchanged for several decades and is higher than in many comparable countries. During 2000 - 2015, the US had the second to lowest Annual Rate of Reduction for stillbirth out of 49 high-resource nations. The top 5 nations had a reduction rate of more than ten times the

US reduction rate of 0.4%.

The emotional, financial, and physical impact on families and society has been well-documented. Yet, the Lancet medical journal has called stillbirth "the most under-studied issue in medicine today."

The World Health Organization recognized the importance of fetal deaths as an indicator of global health by including fetal death rate targets for the first time in their Every Newborn Action Plan published in 2014.

Stigma, lack of awareness, and fatalism have been identified as significant barriers to stillbirth prevention and bereavement support. Adding to the issue, as noted by the Lancet Executive Summary, is that 'no one organization takes responsibility for stillbirth.'

## Star Legacy Foundation is committed to leading stillbirth prevention efforts in the United States. The Stillbirth Scorecard sets the foundation for why this work is important.

The stillbirth rate is the best number to compare our outcomes from year to year, or state to state. It is the number of stillbirths per total births (stillbirths plus live births). 2021 is a good example of this because the number of stillbirths increased (20,854 to 21,105), but the national rate decreased slightly from 5.8 to 5.7. Many will be surprised by this because of the expected increases due to the COVID-19 pandemic. The raw number is stated to honor the number of families who are grieving their babies who were stillborn this year. They will never be forgotten, and they are inspiring us to improve care for future families.

The disparity ratio is calculated by comparing the racial/ethnic group with the lowest/best rate to the group with the highest/worst rate. While no group is immune to these tragedies, this measure is used to understand the tremendous racial and ethnic disparities realized throughout the country. The Maternal Race/Ethnicity section looks at all of the groups by rate. Suppressed data indicates that the numbers were low enough that reporting them could jeopardize family confidentiality.

The Certificate of Birth Resulting in Stillbirth (CBRS) and Stillbirth Tax Credit are new additions to the scorecard this year. An important part of recognizing these families and raising awareness about the prevalence is for the families to receive written documentation from their state that the baby was part of their family. Many states acknowledge this baby with a CBRS or similar docu-

ment and a few allow the parents to claim the baby as a dependent on their taxes for that year. We encourage all states to ensure they are honoring these babies!

The 10-year graph shows the progress - or lack thereof - in recent years. We see that individual states can have more variation from year to year, but the national rate has been very consistent for decades.

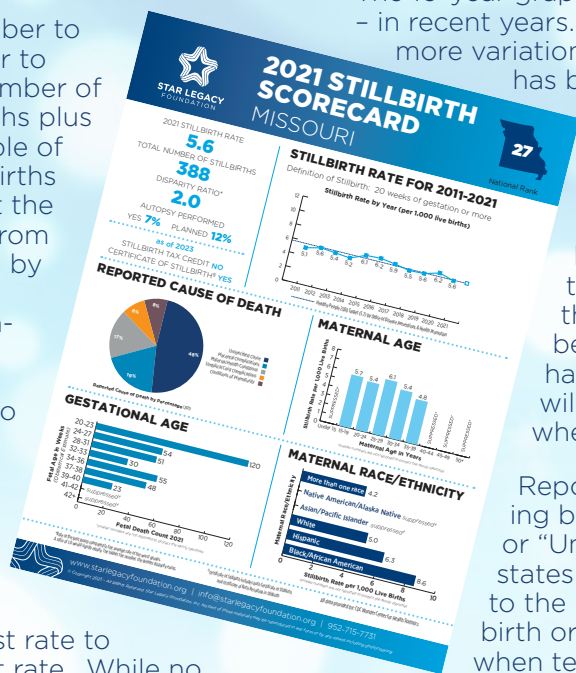

The Healthy People 2020 goal for stillbirth (fetal death) was 5.6/1,000 births. Unfortunately, we did not reach that target nationally. The Healthy People 2030 goal was increased to 5.7/1,000 births - making it easier for states and the nation to achieve the target. In 2021, that target was met, but we found it to be bitter-sweet because the expectation had to be lowered for us to say that. We will continue to pursue reductions even when we are at or below these goals.

Reported Cause of Death is often frustrating because the number of "Not Reported" or "Unspecified" deaths is very high in many states and nationally. Much of this is related to the lack of appropriate testing after a stillbirth or providers not updating death reports when test results are available. However, there remains a significant number of families who never receive an answer for their baby's death and we are dedicated to research that addresses this concern.

Star Legacy is dedicated to the research, education, and support needed to improve these scores! We hope you'll join us in this effort.
